Two Step cluster analysis is a tool designed to handle large data sets. It creates clusters on both categorical and continuous variables. Hierarchical cluster is the most commonly used method of cluster analysis. It combines cases into homogeneous clusters by bringing them together through a series of sequential steps.

Validation approaches include mathematical derivations, analyses of empirical datasets, and monte carlo simulation methods. Next, interpretation and inference procedures in cluster analysis are discussed. Inference procedures involve testing for significant cluster structure and the problem of determining the number of clusters in the data.
