Most tribological studies on graphene have been carried out at the nano-scale and micro-scale, building the case for graphene to be used as a solid lubricant. Recent meso-scale and macro-scale tribological investigations confirm previous predictions and open up new opportunities for graphene use as a solid lubricant in macro-scale systems too.

Graphene: a new emerging lubricant - ScienceDirect

Graphene being two-dimensional material, offers unique friction and wear properties that is not typically seen in conventional materials. Besides its well-established thermal, electrical, optical, and mechanical properties, graphene can serve as a solid or colloidal liquid lubricant. Its high chemical inertness, extre me strength, and easy

Graphene: a new emerging lubricant

Despite intense R&D efforts on graphene for a myriad of existing and future applications, its tribological potential as a lubricant remains relatively unexplored. In this review, we provide an up-to-date survey of recent tribological studies based on graphene from the nano-scale to macro-scale, in particular, its use as a self-lubricating solid or as an additive for lubricating oils.

Graphene is starting to emerge in many industrial sectors as an alternative to the status quo and has started to be used in commercial products. One area that has emerged in the last few years is the use of graphene as a lubricant. When people often think of lubricants, they think of a fluid that is present in their cars or within heavy machinery.

Graphene A New Emerging Lubricant Researchgate

Graphene's hexagonal structure makes it an excellent lubricant. While researchers have found many materials that help to reduce friction, conventional lubricants often have chemical limitations. A recent analysis at the U.S. Department of Energy's Argonne National Laboratory has identified the properties of a newer, exceptionally wear-resistant substance that works in a broader range of environments.

For the application of graphene as a dry lubricant, N, N-dimethylformamide (DMF) was used to deagglomerate graphene platelets and graphite nanoparticles and to apply the platelets and particles to the bearing surfaces [22, 23]. For the investigation, graphene platelets of three different thicknesses were applied: 2 nm, 6–8 nm, and 11–15 nm.
