I = Current in amps; R = Resistance in ohms;  
This is called Ohm's law. Let's say, for  
example, that we have a circuit with the  
potential of 1 volt, a current of 1 amp, and  
resistance of 1 ohm. Using Ohm's Law we can

Then, we can get the current(I) from Ohm's law.  $I = V/R$ . V is the voltage of the battery, 12V. R is the resistance of the lamp. Which I measure its resistance to be about 10 ohms. So the current is.  $I = 12V / 10 \text{ ohms} = 1.2A$ . Thus, the current that the lamp is about 1.2A. You will see that, we can find the current, voltage and resistance with Ohms law triangle.

V represents the voltage measured across the conductor in volts, and R represents the resistance of the conductor in ohms. One way to think of this conceptually is that as a current, I, flows across a resistor (or even across a non-perfect conductor, which has some resistance), R, then the current is losing energy.

Voltage is measured in volts, current is measured in amps and resistance is measured in ohms. A neat analogy to help understand these terms is a system of plumbing pipes. The voltage is equivalent to the water pressure, the current is equivalent to the flow rate, and the resistance is like the pipe size.
